POLICY: Hereditary Angioedema – Takhzyro™ (lanadelumab-flyo for subcutaneous injection
Shire/Takeda)

EFFECTIVE DATE: 1/1/2020

COVERAGE CRITERIA FOR: All UCare Plans

P&T APPROVAL DATE: 9/16/2019

TAC DATE: 8/7/2019

OVERVIEW
Takhzyro is a human monoclonal antibody inhibitor of plasma kallikrein indicated for prophylaxis to
prevent attacks of hereditary angioedema (HAE) in patients ≥ 12 years of age.1

Disease Overview
HAE due to C1 esterase inhibitor (C1-INH) deficiency has two subtypes: HAE type I and HAE type II. HAE diagnosis can be confirmed by measuring functional C1-INH protein levels (usually < 50% of normal in patients with HAE), C4 levels, and C1-INH antigenic levels.2,3 Patients with HAE type I have low C4 and C1-INH antigenic protein levels, along with low levels of functional C1-INH protein. Patients with HAE type II have low C4 and functional C1-INH protein level, with a normal or elevated C1-INH antigenic protein level. C1-INH replacement therapies are appropriate for both HAE type I and type II.

Patients with the third type of HAE, currently called HAE with normal C1-INH (previously referred to as HAE type III), have normal C4 and C1-INH antigenic protein levels.4 The exact cause of HAE with normal C1-INH has not been determined. There are no randomized or controlled clinical trial data available with any therapy for use in HAE with normal C1-INH.4,5 Until data from randomized controlled studies become available, no firm recommendations regarding the treatment of HAE with normal C1-INH can be made.4

Guidelines
Per the World Allergy Organization/European Academy of Allergy and Clinical Immunology guidelines (2017), C1-INH concentrate is first-line for long-term prophylaxis.3 Androgens should not be used in pregnant or breastfeeding women, or in children < 16 years of age. In other populations, the use of androgens for long-term prophylaxis may be considered as second-line but should be considered critically due to potential for adverse events. Therefore, the US Hereditary Angioedema Association Medical Advisory Board’s position (2013) is that anabolic androgens should not be used in patients who have a preference for alternative therapy and that patients should not be required to fail anabolic androgen therapy as a prerequisite to receiving prophylactic C1-INH therapy.6 Plasma-derived C1-INH therapy has been proven to be effective and safe for long-term prophylactic therapy. Of note, these guidelines have not been updated to include Takhzyro.

POLICY STATEMENT
Prior authorization is recommended for medical benefit coverage of Takhzyro. Approval is recommended for those who meet the Criteria and Dosing for the listed indication(s). Extended approvals are allowed if the patient continues to meet the Criteria and Dosing. Requests for doses outside of the established dosing documented in this policy will be considered on a case-by-case basis by an Express Scripts clinician (i.e., Medical Director or Pharmacist). All approvals are provided for the duration noted below.
**Documentation:** Documentation will be required where noted in the criteria as [documentation required]. Documentation may include, but is not limited to, chart notes, laboratory records, and prescription claims records.

**RECOMMENDED AUTHORIZATION CRITERIA**

**FDA-Approved Indications**

1. **Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency [Type I or Type II] – Prophylaxis.** Approve Takhzyro for the duration noted if the patient meets one of the following criteria (A or B):
   
   **A) Initial therapy.** Approve for 1 year if the patient meets both of the following criteria (i and ii):
   
   i. The patient has HAE type I or type II as confirmed by the following diagnostic criteria (a and b):
      
      a) Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values [documentation required]; AND
      
      b) Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values [documentation required]; AND
   
   ii. The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

   **B) Patients currently receiving Takhzyro prophylaxis.** Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):
   
   i. Patient is currently receiving Takhzyro for HAE type I or type II prophylaxis [documentation required to confirm HAE type I or type II diagnosis]; AND
   
   ii. According to the prescriber, the patient has had a favorable clinical response (e.g., decrease in number of HAE acute attack frequency, decrease in HAE attack severity, decrease in duration of HAE attacks) since initiating Takhzyro prophylactic therapy compared with baseline (i.e., prior to initiating prophylactic therapy); AND
   
   iii. The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

**Dosing.** Approve up to a maximum dose of 300 mg by subcutaneous injection, no more frequently than once every 2 weeks.

**CONDITIONS NOT RECOMMENDED FOR APPROVAL**

Takhzyro has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Concomitant Use with Other HAE Prophylactic Therapies (e.g., Cinryze®, Haegarda®).** Takhzyro has not been studied in combination with other prophylactic therapies for HAE, and combination therapy for long-term prophylactic use is not recommended. Patients may use other medications, including Cinryze, for on-demand treatment of acute HAE attacks, and for short-term (procedural) prophylaxis.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.
